Preface

A scientific journal without an adequate index lacks much of its value. There is an old adage "Never put off till tomorrow what one can do today", which can be amplified by "Tomorrow never comes". How very true this can be. The fortunes, or perhaps the misfortunes of this ten-years scientific index, are a striking example of the pitfalls of delay. As is already well-known, for reasons of economy, no scientific index was printed in 1950. Originally intended as a temporary measure this lapse inevitably snowballed and all-too-quickly ten years passed before Mrs. B. P. Hall, who is deserving of our grateful thanks, initiated the appropriate action to rectify the matter. But much can happen in ten years and owing to greatly increased costs of production the relative financial commitment in 1960 was infinitely higher than in 1950. Thanks, however, to a much appreciated grant from the Royal Society, supplemented by the generosity of many members of the Club, to all of whom we express our gratitude, it has been possible to undertake what has proved to be a costly business. Further, our thanks are due to Mrs. Hall not only for her enthusiasm in getting this project going, but also for her praiseworthy action—deeds being better than words—by generously undertaking annually since 1960 the compilation of the Bulletin's scientific index. Finally, a warm tribute must be paid to Miss Frances Duckett who has carried out so efficiently a particularly exacting and onerous task.

CHARLES R. S. PITMAN,
Chairman, Publications Sub-committee.

27th January 1963.

10.
PURCHASED

Figure 1. Schematic diagram of the experimental setup. The subject is seated in a chair and views the screen through a mirror. The screen displays the target (a red dot) and the starting position (a black dot). The subject's hand is positioned at the starting position. The distance between the starting position and the target is 10 cm. The subject is instructed to move the hand from the starting position to the target. The distance between the starting position and the target is 10 cm. The subject is instructed to move the hand from the starting position to the target. The distance between the starting position and the target is 10 cm.
